

**Wacker Neuson
Group**

Quality, energy and environmental policy of the Wacker Neuson Group

The Wacker Neuson Group is one of the world's leading manufacturers of construction equipment and compact machinery. The company is aware of its responsibility for customer-centric, energy-efficient and environmentally sound business operations worldwide and is committed to protecting the environment, preventing or mitigating adverse environmental impacts, and continually improving its energy and environmental performance and customer satisfaction.

Professional quality and sustainability management is part of the 2022 strategy, where focusing, excellence and acceleration in conjunction with talented and satisfied employees are the cornerstones of customer focus.

Efficiency in production processes, climate protection and resource conservation are therefore important guidelines, as are the avoidance of pollutants, the reduction of waste and the testing of materials for their recyclability at the end of the product life cycle. The products and services are of high quality and have been optimized with regard to environmental impact, such as fuel consumption or emissions, as well as customer benefit in terms of quality and service life. They are subject to fixed maintenance and service cycles that extend their service life. The Group also has a high-performance zero-emission product line, with which the entire construction process of a classic, inner-city construction site can now be realized completely emission-free and with reduced noise.

The Wacker Neuson Group ensures that it meets all quality, environmental and energy requirements and provides the resources necessary to achieve its strategic and operational goals. The procurement of materials required for the manufacture of the products - for example in the selection of building services and production machines as well as related components and services - also ensures that energy-related performance is improved and that consistently high quality is ensured.

The effectiveness of the quality, energy and environmental policy as well as the achievement of objectives are regularly reviewed both in the context of management evaluation and in the context of external audits. All employees and third parties working at the respective sites have access to and knowledge of the quality, energy and environmental policies. To ensure this, it is regularly communicated both internally and externally.
